

ODAD Update

(1) Memory-bank ODAD operating point

- Failure audit showed memory-bank ODAD is mainly **under-confident**, not incapable.
- Static threshold calibration recovers detection while preserving reliability.
- Recommended report point: conf=0.15.**
- Architecture work is paused while reporting/calibration results are consolidated.

Quantitative Reliability Snapshot

(2) Full-stream proxy metrics

Model	Conf.	Det.	Weird	Jump	Max Bad
Current ODAD	0.25	87.0%	36.3%	9.1%	198
Memory ODAD	0.25	85.6%	6.2%	3.0%	67
Memory ODAD	0.15	88.4%	6.2%	3.0%	51
FDA-mix	0.25	98.2%	21.5%	1.9%	41

Det. = detection rate; Weird/Jump/Max Bad are proxy reliability metrics.

- Memory-bank @0.15 improves detection over default while retaining low proxy failures.
- Current ODAD has similar detection but much worse **weird/jump/streak behavior**.

Lab Updates

(3) Pose-pipeline relevance

- FDA-trained YOLO-Segment remains active detector in current pose pipeline.
- Memory-bank ODAD provides a lower-failure online adaptation candidate.
- Next step: manually audit aggressive 0.05 threshold before calibration/head-bias work.
- Reporting now emphasizes calibrated operating point rather than new architecture.

Qualitative / Operating Point

(4) Low-confidence accepts and threshold tradeoff

Static threshold sweep: 0.15 is the reportable balance; 0.05 remains manual-review/aggressive.
