

ODAD Update

(1) Online adaptation development

- **Top-k teacher selection** remains the best deployable ODAD branch.
- Track-aware/multi-track memory cleaned boxes but reduced detection.
- Stricter memory/geometry gates suppress valid target views.
- Next: checkpoint selection/rollback using online reliability proxies.

Lab Updates

(3) SSTI/Poster Updates

- USSF Symposium poster drafted; awaiting final team review.
- Reliability tooling now writes summaries, streaks, and galleries.
- Next ODAD run: online checkpoint selection/rollback.

Quantitative Ablation / Reliability

(2) Accuracy + error metrics on lab imagery

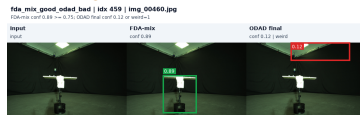

Model	Det.	Weird	Jump	Bad	Good
FDA-mix	99.6%	21.6%	2.0%	15	97
Current ODAD	96.8%	27.8%	10.6%	42	135
Multi-track	93.2%	24.4%	8.0%	42	163

Streaks use ordered frames; Good = $\text{conf} \geq 0.25$, no weird box/jump.

- Multi-track improves symptoms but misses the 95% detection target.
- Current ODAD remains the best deployable tradeoff.
- Streaks expose stability better than confidence alone.

Qualitative Reliability Examples

(4) ODAD vs FDA-mix galleries

FDA-mix good / Multi-track bad

Multi-track good / FDA-mix weak
